

Icefall, Lambert Glacier, Antarctica
The Lambert Glacier in Antarctica, is the world's largest glacier. The focal point of this image is an icefall that feeds into the Lambert glacier from the vast ice sheet covering the polar plateau. Ice flows like water, albeit much more slowly. Cracks can be seen in this icefall as it bends and twists on its slow-motion descent 1300 feet (400 meters) to the glacier below.

Landsat 7 data acquired 12/02/2000

1" = 1.6 miles (2.5 km)
